There are some other excellent free options to choose from, such as Krita, GIMP, and Paint.NET. Many professional photographers and graphic designers choose the paid-for programs instead, though. In the following sections, I cover the general range of actions available to you. Photoshop masks In Photoshop, a mask is a way to control which part of an image you want to keep or which you want to replace with different information. It helps you create realistic effects when you blend or paint in background and foreground elements. To create a mask, use the Elliptical Marquee tool (see Figure 8-1), and you'll see the marquee crosshairs change from a dotted line to a solid line as you drag across the image, filling in the area that's selected. You can also use the Eraser tool to mask off parts of an image. Enlarge the image, and you see four masking options: the default masking method, Content-Aware Masks, the Lasso tool, and Gradient Masks. I explain each of these options in the following sections. **Figure 8-1:** Create a mask by using the Elliptical Marquee tool. Converting images to grayscale This step is often skipped, but it's something that can help with color management, creating more realistic images, and making the biggest improvement in image quality. This step is important when working with RAW images because no adjustment can be applied to them until they've been converted to a color space that's native to Photoshop. To convert a RAW image to grayscale, choose Image⇒Mode⇒Grayscale Color and convert the image to grayscale. After you convert an image to grayscale, you can apply adjustments as usual, including color corrections and color balance. Automatic color management This is one of the most important tools you can use in your workflow. Each time you use a new camera or scanner, it stores the color information of the image in a file that's associated with the image. This particular file gives Photoshop more details than the basic RGB or CMYK color space options. After you convert an image to grayscale, Auto-Align Layers can help by aligning the layers in your image. The default alignment setting is color-managed, which allows Photoshop to automatically align the colors of the layers in

Q: FullCalendar display incorrect month numbers on weekdays I have a fullCalendar instance that I'm displaying with a number of event fields. This works well, but if the day of the week is a weekday, the number of the month is incorrect. For example, it will display "Jan 14" as if it were "Jan 13" if that is the 14th of the month. FullCalendar expects this form: And I'm getting this: My code: \$.ajax({ type: "GET", url: "schedule.php?startdate="+\$("#from").val()+"&stopdate="+\$("#to").val() dataType: "json", cache: false, success: function(data) { var calendarEl = \$("#calendar").fullCalendar({ // calendar options }); calendarEl.fullCalendar('renderEvent', { id: data.id, title: data.title, start: data.start, end: data.end, allDay: true }, true); } }); A: I found the answer when I read the fullCalendar documentation. For debugging purposes, you can set calendarEl.fullCalendar.view.month to 0. This will set the first day of the month to be day 1. So in the success function of the \$.ajax I can do this: calendarEl.fullCalendar('view',0); This will set the display date to January 1. Now everything shows up correctly. ### What's New In?

The present invention relates generally to plumbing fixtures and, more particularly, to a wrinkle-resistant drainage device for drains. Prior art plumbing fixtures are generally described and illustrated in U.S. Pat. Nos. 3,771,066; 4,620,590; 5,353,705; 5,772,572; 5,951,057; 6,017,066; and 6,273,144. Such plumbing fixtures include various types of traps. In the case of residential and commercial restrooms, most commonly used fixtures include a separate sump pump and a separate drain for general washdown. In the case of a multiple sinks, typically a sump tank is located beneath each sink. A separate drain for each sink is generally not used due to the high cost of construction. In the case of multiple sinks installed in a single housing, separation of the sinks from a sump tank can be easily and economically performed with a separation wall. However, in the case of sinks that are not physically separated from the sump tank, there is no easy way to prevent wrinkle-type damage of drains which occur when the drains are pressured to drain water from the sinks. The result is that, because of the possibility of such wrinkle damage, most commonly used sinks are not placed side-by-side in order to eliminate the possibility of damage to the drains. This results in less than full usage of the sink space in multi sink installations. Additionally, separate traps for sump and drain are commonly not used because of the high cost of construction. Finally, because it is extremely desirable to install multiple sinks near each other and because the problems associated with wrinkle damage cause a significant amount of wasted space, the sinks that are most frequently used are the oldest and least expensive sink. Thus, the aforementioned problems are usually encountered at the time of replacement of sinks, usually 10 to 20 years after installation. Hence, the need exists for a highly reliable, inexpensive drainage device for wastes that solves the aforementioned problems associated with wrinkle-type damage to drains. It is the object of the present invention to provide a drainage device that prevents wrinkle-type damage to drains that solves the aforementioned problems. These and other objects and advantages are achieved by the drainage device of the present invention. In one aspect of the present invention, a drain has a main body defining a drain opening and a serpentine annular constriction in communication with the drain opening. The drain opening preferably extends through the main body
